1 PROBLEM

Through what angle must the axes be turned to reduce the equation

$$\mathbf{x}^T \begin{pmatrix} 1 & -1 \\ -1 & -1 \end{pmatrix} \mathbf{x} = 1 \quad (1.0.1)$$

to the form

$$\mathbf{x}^T \begin{pmatrix} 0 & 1/2 \\ 1/2 & 0 \end{pmatrix} \mathbf{x} = c \quad (1.0.2)$$

where c is a constant.

2 SOLUTION

Lemma 2.1. *Orthonormal matrices preserves angle.*

Proof. Let \mathbf{u} and \mathbf{v} be vectors such that angle between \mathbf{u} and \mathbf{v} is θ_1 . Let \mathbf{Q} be given orthonormal matrix, and let θ_2 be angle between $\mathbf{Q}\mathbf{u}$ and $\mathbf{Q}\mathbf{v}$.

$$\cos \theta_1 = \frac{\mathbf{u}^T \mathbf{v}}{\|\mathbf{u}\| \|\mathbf{v}\|} \quad (2.0.1)$$

$$\cos \theta_2 = \frac{(\mathbf{Q}\mathbf{u})^T (\mathbf{Q}\mathbf{v})}{\|\mathbf{Q}\mathbf{u}\| \|\mathbf{Q}\mathbf{v}\|} = \frac{\mathbf{u}^T \mathbf{v}}{\|\mathbf{u}\| \|\mathbf{v}\|} = \cos \theta_1 \quad (2.0.2)$$

□

The general second order equation can be expressed as follows,

$$\mathbf{x}^T \mathbf{V} \mathbf{x} + 2\mathbf{u}^T \mathbf{x} + f = 0 \quad (2.0.3)$$

From (1.0.1) and (2.0.3)

$$\mathbf{V} = \begin{pmatrix} 1 & -1 \\ -1 & -1 \end{pmatrix} \quad (2.0.4)$$

$$\mathbf{u} = \begin{pmatrix} 0 \\ 0 \end{pmatrix} \quad (2.0.5)$$

$$f = -1 \quad (2.0.6)$$

The matrix \mathbf{V} can be decomposed as,

$$\mathbf{V} = \mathbf{P} \mathbf{D} \mathbf{P}^T \quad \mathbf{D} = \begin{pmatrix} \lambda_1 & 0 \\ 0 & \lambda_2 \end{pmatrix} \quad (2.0.7)$$

where λ_1 and λ_2 are the eigen values of \mathbf{V} , and \mathbf{P} contains the eigen vectors corresponding to the eigen values λ_1 and λ_2 . The affine transformation is given by,

$$\mathbf{x} = \mathbf{P}\mathbf{y} + \mathbf{c} \quad (2.0.8)$$

where, \mathbf{P} indicates the rotation of axes and \mathbf{c} indicates the shift of origin.

Eigen values of \mathbf{V} are,

$$|\mathbf{V} - \lambda \mathbf{I}| = 0 \quad (2.0.9)$$

$$\Rightarrow \begin{vmatrix} 1 - \lambda & -1 \\ -1 & -1 - \lambda \end{vmatrix} = 0 \quad (2.0.10)$$

$$\Rightarrow (1 - \lambda)(-1 - \lambda) - 1 = 0 \quad (2.0.11)$$

$$\Rightarrow \lambda^2 - 2 = 0 \quad (2.0.12)$$

$$\Rightarrow \lambda = \pm \sqrt{2}, \quad \mathbf{D} = \begin{pmatrix} \sqrt{2} & 0 \\ 0 & -\sqrt{2} \end{pmatrix} \quad (2.0.13)$$

Eigen vector for $\lambda_1 = \sqrt{2}$,

$$\mathbf{V} - \lambda_1 \mathbf{I} = \begin{pmatrix} 1 - \sqrt{2} & -1 \\ -1 & -1 - \sqrt{2} \end{pmatrix} \xrightarrow{r_1/1-\sqrt{2}} \begin{pmatrix} 1 & -1/1-\sqrt{2} \\ -1 & -1-\sqrt{2} \end{pmatrix} \quad (2.0.14)$$

$$\mathbf{V} - \lambda_1 \mathbf{I} = \begin{pmatrix} 1 & -1/1 - \sqrt{2} \\ -1 & -1 - \sqrt{2} \end{pmatrix} \xrightarrow{r_2=r_1+r_2} \begin{pmatrix} 1 & -1/1 - \sqrt{2} \\ 0 & 0 \end{pmatrix} \quad (2.0.15)$$

Hence,

$$\mathbf{P}_1 = \begin{pmatrix} 1 - \sqrt{2} \\ 1 \end{pmatrix} = \begin{pmatrix} \frac{1-\sqrt{2}}{4-2\sqrt{2}} \\ \frac{1}{4-2\sqrt{2}} \end{pmatrix} \quad (2.0.16)$$

Eigen vector for $\lambda_2 = -\sqrt{2}$,

$$\mathbf{V} - \lambda_2 \mathbf{I} = \begin{pmatrix} 1 + \sqrt{2} & -1 \\ -1 & -1 + \sqrt{2} \end{pmatrix} \xrightarrow{r_1/1+\sqrt{2}} \begin{pmatrix} 1 & -1/1 + \sqrt{2} \\ -1 & -1 + \sqrt{2} \end{pmatrix} \quad (2.0.17)$$

$$\mathbf{V} - \lambda_2 \mathbf{I} = \begin{pmatrix} 1 & -1/1 + \sqrt{2} \\ -1 & -1 + \sqrt{2} \end{pmatrix} \xrightarrow{r_2=r_1+r_2} \begin{pmatrix} 1 & -1/1 + \sqrt{2} \\ 0 & 0 \end{pmatrix} \quad (2.0.18)$$

Hence,

$$\mathbf{P}_2 = \begin{pmatrix} 1 + \sqrt{2} \\ 1 \end{pmatrix} = \begin{pmatrix} \frac{1+\sqrt{2}}{4+2\sqrt{2}} \\ \frac{1}{4+2\sqrt{2}} \end{pmatrix} \quad (2.0.19)$$

Thus,

$$\mathbf{P} = \begin{pmatrix} \frac{1-\sqrt{2}}{4-2\sqrt{2}} & \frac{1+\sqrt{2}}{4+2\sqrt{2}} \\ \frac{1}{4-2\sqrt{2}} & \frac{1}{4+2\sqrt{2}} \end{pmatrix} \quad (2.0.20)$$

Since,

$$|\mathbf{V}| = \begin{vmatrix} 1 & -1 \\ -1 & -1 \end{vmatrix} = -2 \neq 0 \quad (2.0.21)$$

and $\lambda_1 > 0$ and $\lambda_2 < 0$. Thus, (1.0.1) represents a hyperbola

Also \mathbf{V} can be written as,

$$\mathbf{V} = \begin{pmatrix} \frac{1-\sqrt{2}}{4-2\sqrt{2}} & \frac{1+\sqrt{2}}{4+2\sqrt{2}} \\ \frac{1}{4-2\sqrt{2}} & \frac{1}{4+2\sqrt{2}} \end{pmatrix} \begin{pmatrix} \sqrt{2} & 0 \\ 0 & -\sqrt{2} \end{pmatrix} \begin{pmatrix} \frac{1-\sqrt{2}}{4-2\sqrt{2}} & \frac{1}{4-2\sqrt{2}} \\ \frac{1+\sqrt{2}}{4+2\sqrt{2}} & \frac{1}{4+2\sqrt{2}} \end{pmatrix} \quad (2.0.22)$$

Using lemma (2.1) and the fact that exchanging rows is multiplication by an orthonormal matrix, Thus \mathbf{V} can be further written as

$$\mathbf{V} = \begin{pmatrix} \frac{1-\sqrt{2}}{4-2\sqrt{2}} & \frac{1+\sqrt{2}}{4+2\sqrt{2}} \\ \frac{1}{4-2\sqrt{2}} & \frac{1}{4+2\sqrt{2}} \end{pmatrix} \begin{pmatrix} 0 & -\sqrt{2} \\ \sqrt{2} & 0 \end{pmatrix} \begin{pmatrix} \frac{1-\sqrt{2}}{4-2\sqrt{2}} & \frac{1}{4-2\sqrt{2}} \\ \frac{1+\sqrt{2}}{4+2\sqrt{2}} & \frac{1}{4+2\sqrt{2}} \end{pmatrix} \quad (2.0.23)$$

Now, (1.0.1) can be transformed as

$$\mathbf{x}^T \begin{pmatrix} \frac{1-\sqrt{2}}{4-2\sqrt{2}} & \frac{1+\sqrt{2}}{4+2\sqrt{2}} \\ \frac{1}{4-2\sqrt{2}} & \frac{1}{4+2\sqrt{2}} \end{pmatrix} \begin{pmatrix} 0 & -\sqrt{2} \\ \sqrt{2} & 0 \end{pmatrix} \begin{pmatrix} \frac{1-\sqrt{2}}{4-2\sqrt{2}} & \frac{1}{4-2\sqrt{2}} \\ \frac{1+\sqrt{2}}{4+2\sqrt{2}} & \frac{1}{4+2\sqrt{2}} \end{pmatrix} \mathbf{x} = 1 \quad (2.0.24)$$

$$c\mathbf{x}^T \begin{pmatrix} \frac{1-\sqrt{2}}{4-2\sqrt{2}} & \frac{1+\sqrt{2}}{4+2\sqrt{2}} \\ \frac{1}{4-2\sqrt{2}} & \frac{1}{4+2\sqrt{2}} \end{pmatrix} \begin{pmatrix} 0 & -\sqrt{2} \\ \sqrt{2} & 0 \end{pmatrix} \begin{pmatrix} \frac{1-\sqrt{2}}{4-2\sqrt{2}} & \frac{1}{4-2\sqrt{2}} \\ \frac{1+\sqrt{2}}{4+2\sqrt{2}} & \frac{1}{4+2\sqrt{2}} \end{pmatrix} \mathbf{x} = c \quad (2.0.25)$$

$$\mathbf{x}^T \begin{pmatrix} \frac{1-\sqrt{2}}{4-2\sqrt{2}} & \frac{1+\sqrt{2}}{4+2\sqrt{2}} \\ \frac{1}{4-2\sqrt{2}} & \frac{1}{4+2\sqrt{2}} \end{pmatrix} \begin{pmatrix} 0 & -c\sqrt{2} \\ c\sqrt{2} & 0 \end{pmatrix} \begin{pmatrix} \frac{1-\sqrt{2}}{4-2\sqrt{2}} & \frac{1}{4-2\sqrt{2}} \\ \frac{1+\sqrt{2}}{4+2\sqrt{2}} & \frac{1}{4+2\sqrt{2}} \end{pmatrix} \mathbf{x} = c \quad (2.0.26)$$

$$\left(\begin{pmatrix} \frac{1-\sqrt{2}}{4-2\sqrt{2}} & \frac{1+\sqrt{2}}{4+2\sqrt{2}} \\ \frac{1}{4-2\sqrt{2}} & \frac{1}{4+2\sqrt{2}} \end{pmatrix} \mathbf{x} \right)^T \begin{pmatrix} 0 & -c\sqrt{2} \\ c\sqrt{2} & 0 \end{pmatrix} \left(\begin{pmatrix} \frac{1-\sqrt{2}}{4-2\sqrt{2}} & \frac{1}{4-2\sqrt{2}} \\ \frac{1+\sqrt{2}}{4+2\sqrt{2}} & \frac{1}{4+2\sqrt{2}} \end{pmatrix} \mathbf{x} \right) = c \quad (2.0.27)$$

Consider the rotation transformation

$$\mathbf{x} = \mathbf{P}\mathbf{y} \quad (2.0.28)$$

$$\mathbf{x} = \begin{pmatrix} \frac{1-\sqrt{2}}{4-2\sqrt{2}} & \frac{1+\sqrt{2}}{4+2\sqrt{2}} \\ \frac{1}{4-2\sqrt{2}} & \frac{1}{4+2\sqrt{2}} \end{pmatrix} \mathbf{y} \quad (2.0.29)$$

$$\mathbf{y} = \mathbf{P}^{-1}\mathbf{x} \quad (2.0.30)$$

$$\Rightarrow \mathbf{y} = \begin{pmatrix} \frac{1-\sqrt{2}}{4-2\sqrt{2}} & \frac{1}{4-2\sqrt{2}} \\ \frac{1+\sqrt{2}}{4+2\sqrt{2}} & \frac{1}{4+2\sqrt{2}} \end{pmatrix} \mathbf{x} \quad (\mathbf{P}^T = \mathbf{P}^{-1}) \quad (2.0.31)$$

Using (2.0.31) in (2.0.27), we have

$$\mathbf{y}^T \begin{pmatrix} 0 & -c\sqrt{2} \\ c\sqrt{2} & 0 \end{pmatrix} \mathbf{y} = c \quad (2.0.32)$$

Equation (1.0.1) and (2.0.32) are same with

$$-c\sqrt{2} = 1/2 \quad (2.0.33)$$

$$c\sqrt{2} = 1/2 \quad (2.0.34)$$

$$\Rightarrow c = 0 \quad (2.0.35)$$

The plot for (1.0.1) and (1.0.2) are plotted below:

Fig. 0: Hyperbola $x^2 - 2xy - y^2 - 1 = 0$

Fig. 0: Hyperbola $xy = c$
