

Properties of Determinant

Saransh Bali

Abstract—This a simple document that proves certain properties of determinant.

1 PROBLEM

Show that the following holds for all $n \times n$ matrices \mathbf{A} and \mathbf{B} :

$$\det(\mathbf{AB}) = \det(\mathbf{A}) \det(\mathbf{B}) \quad (1.0.1)$$

$$\det(\mathbf{A})^T = \det(\mathbf{A}) \quad (1.0.2)$$

Hence show that if \mathbf{A} has orthonormal columns, then $|\det \mathbf{A}| = 1$

2 SOLUTION

We start by writting $\mathbf{A} = (A_{.,1} \dots A_{.,n})$, where $A_{.,k}$ is a k th column of \mathbf{A} and $\mathbf{B} = (B_{.,1} \dots B_{.,n})$, where $B_{.,k}$ is a k th column of \mathbf{B} . Also, let \mathbf{e}_k be the $n \times 1$ column vector that equals 1 in the k th position and 0 elsewhere.

Note that $\mathbf{Ae}_k = A_{.,k}$ and $\mathbf{Be}_k = B_{.,k}$. Furthermore, $\mathbf{B}_{.,k} = \sum_{m=1}^n \mathbf{B}_{m,k} \mathbf{e}_m$. Also, the definition of matrix multiplication easily implies that

$$\mathbf{AB} = (\mathbf{AB}_{.,1} \dots \mathbf{AB}_{.,n}) \quad (2.0.1)$$

$$\det(\mathbf{AB}) = \det(\mathbf{AB}_{.,1} \dots \mathbf{AB}_{.,n}) \quad (2.0.2)$$

$$\det(\mathbf{AB}) =$$

$$\det\left(\mathbf{A} \left(\sum_{m=1}^n B_{m,1} \mathbf{e}_m\right) \dots \mathbf{A} \left(\sum_{m=1}^n B_{m,n} \mathbf{e}_m\right)\right) \quad (2.0.3)$$

$$\det(\mathbf{AB}) =$$

$$\det\left(\left(\sum_{m=1}^n B_{m,1} \mathbf{Ae}_m\right) \dots \left(\sum_{m=1}^n B_{m,n} \mathbf{Ae}_m\right)\right) \quad (2.0.4)$$

$$\det(\mathbf{AB}) =$$

$$\sum_{m_1=1}^n \dots \sum_{m_n=1}^n B_{m_1,1} \dots B_{m_n,n} \det(\mathbf{Ae}_{m_1} \dots \mathbf{Ae}_{m_n}) \quad (2.0.5)$$

where the (2.0.5) follows from the repeated applications of the linearity of determinant as a function of one column at a time. In the sum above in (2.0.5), all terms in which $m_j = m_k$ for some $j \neq k$ can be ignored, because the determinant of a matrix with two equal columns is 0.

Thus instead of summing over all m_1, \dots, m_n with each m_j taking on values $1, \dots, n$ we can sum just over the permutations, where the m_j 's have distinct values. In other words,

$$\det \mathbf{AB} =$$

$$\sum_{(m_1, \dots, m_n) \in \text{permn}} B_{m_1,1} \dots B_{m_n,n} \det(\mathbf{Ae}_{m_1} \dots \mathbf{Ae}_{m_n}) \quad (2.0.6)$$

$$\det \mathbf{AB} =$$

$$\sum_{(m_1, \dots, m_n) \in \text{permn}} B_{m_1,1} \dots B_{m_n,n} (\text{sign}(m_1 \dots m_n)) \det \mathbf{A} \quad (2.0.7)$$

$$\det \mathbf{AB} =$$

$$\det \mathbf{A} \sum_{(m_1, \dots, m_n) \in \text{permn}} (\text{sign}(m_1 \dots m_n)) B_{m_1,1} \dots B_{m_n,n} \quad (2.0.8)$$

Hence,

$$\det(\mathbf{AB}) = \det(\mathbf{A}) \det(\mathbf{B}) \quad (2.0.9)$$

Now, if we interchange roles of \mathbf{A} and \mathbf{B} in (2.0.1), we get

$$\det(\mathbf{AB}) = \det(\mathbf{B}) \det(\mathbf{A}) \quad (2.0.10)$$

Hence

$$\det(\mathbf{AB}) = \det(\mathbf{A}) \det(\mathbf{B}) = \det(\mathbf{B}) \det(\mathbf{A}) \quad (2.0.11)$$

Now to prove

$$\det(\mathbf{A})^T = \det(\mathbf{A}) \quad (2.0.12)$$

We here consider two cases: $\det \mathbf{A} = 0$ and $\det \mathbf{A} \neq 0$. First we assume that $\det \mathbf{A} = 0$, then we know that \mathbf{A} is not invertible, that means \mathbf{A}^T is also not invertible. Hence $\det(\mathbf{A})^T = 0$ and hence $\det(\mathbf{A}) = \det(\mathbf{A})^T$.

Now, consider $\det \mathbf{A} \neq 0$, thus \mathbf{A} is not invertible and therefore can be written as a product $\mathbf{E}_1 \dots \mathbf{E}_k$ of elementary matrices. We know that for an elementary matrix \mathbf{E} , $\det(\mathbf{E})^T = \det \mathbf{E}$

$$\mathbf{A} = \mathbf{E}_1 \dots \mathbf{E}_k \quad (2.0.13)$$

$$\mathbf{A}^T = (\mathbf{E}_1 \dots \mathbf{E}_k)^T \quad (2.0.14)$$

$$\det \mathbf{A}^T = \det((\mathbf{E}_k)^T \dots (\mathbf{E}_1)^T) \quad (2.0.15)$$

$$\det \mathbf{A}^T = \det \mathbf{E}_k^T \dots \det \mathbf{E}_1^T \quad (2.0.16)$$

$$\det \mathbf{A}^T = \det \mathbf{E}_1 \dots \det \mathbf{E}_k \quad (2.0.17)$$

$$\det \mathbf{A}^T = \det(\mathbf{E}_1 \dots \mathbf{E}_k) \quad (2.0.18)$$

$$\det \mathbf{A}^T = \det \mathbf{A} \quad (2.0.19)$$

Now, to prove that if \mathbf{A} has orthonormal columns, then $|\det \mathbf{A}| = 1$. Note that if \mathbf{A} has orthonormal columns, then $\mathbf{AA}^T = \mathbf{A}^T \mathbf{A} = \mathbf{I}$. Since, we know that, $\det \mathbf{A} = \det \mathbf{A}^T$. Thus,

$$\det(\mathbf{AA}^T) = \det \mathbf{I} \quad (2.0.20)$$

$$\det \mathbf{A} \det \mathbf{A}^T = \det \mathbf{I} \quad (2.0.21)$$

$$\det \mathbf{A} \det \mathbf{A} = \det \mathbf{I} \quad (2.0.22)$$

$$(\det \mathbf{A})^2 = 1 \quad (2.0.23)$$

$$\implies |\det \mathbf{A}| = 1 \quad (2.0.24)$$
